Some trends in electron microscopy of skin have emerged and should be pursued in the future. The fine structure and some basic cellular reaction patterns of epidermal cells are discussed to illustrate the interplay of morphologic, cytochemical, and tracer studies.

Scanning Electron Microscope (SEM) It is not completely clear who first proposed the principle of scanning the surface of a specimen with a finely focused electron beam to produce an image of the surface. The first published description appeared in 1935 in a paper by the German physicist Dr. Max Knoll.

In clinical practice, scanning electron microscopy (SEM) has been commonly used for observation of the ultrastructure of numerous materials, pathogens, and diseases. SEM images can be magnified thousands of times.
